Sustainable Living in Communal Housing Projects

If society is to cope with problems of climate change and global inequality there will need to be a sustainable transformation that affects all domains of social life . Different forms of communal housing and living are often presented as “real life laboratories” or “pioneers” of such a transformation. In this seminar I will present a research project that seeks to understand the conditions under which more sustainable practices are realized. I will discuss how theories of practice can help conceptualize and understand communal housing projects as a bundle of practices and how these are connected with the material and social situation of these projects.
